ATOMIC TRIAD CONVERGENCE: LIVE RUN PROGRESSION

Live Research Snapshot • Total Triads Evaluated: 198 • 2026-10-13 20:10:39 CEST

Live Measured Performance Across Atomic Triads

Atomic Triad Category	Matrix 33 ID	Raw Uncompensated	Trained Inverted MAML	Net Gain (Delta)	Status
All-Time Best Triad	Variant 69	4.44 bits	5.60 bits	+1.16 bits	Trained (Mode A)
Current Moving Average	Across 198 runs	2.06 bits	2.18 bits	+0.12 bits	In Progress
Live Physical FPGA Board	T120/T20 Board	2.12 bits (Mode B)	4.00 bits (Mode A)	+1.88 bits	Active Hardware
Lowest / Difficult Triad	Variant 19	3.01 bits	2.82 bits	-0.19 bits	Asymmetric M33

Real-Time Status: Currently executing iteration 2 across the 100 distinct atomic triads. Live physical FPGA telemetric resolution is locked at **4.00 bits** while individual surrogate triads range dynamically from 2.82b to 5.60b.
